

## 2-Way Flexible Connector for LED Track Lighting Systems

### OVERVIEW

---

The S-TK3HF is a 2-way flexible connector designed for use with LED track lighting systems. It allows two track sections to be joined at variable angles, accommodating layout configurations where a rigid straight or fixed-angle connector is not practical. The flexible joint enables installers to route track along non-linear ceiling planes or around architectural features without cutting or modifying the track itself.

No electrical or photometric performance data is available in the current source documentation. Contractors should verify compatibility with the specific track system voltage, current rating, and conductor configuration before installation. The connector is intended for commercial and light industrial track lighting applications.

No certifications, compliance markings, or warranty terms are confirmed in the available source data. Specifiers and purchasing teams should request a current product data sheet or compliance documentation from Poli LED & Signs prior to project specification or procurement.
