

Bronze Switch with Patina Finish, Decorative Wiring Device

- Constructed from solid bronze for a substantial, traditional wiring device
- Patina finish delivers a weathered, oxidized surface appearance
- Functions as a standard lighting and electrical control switch
- Suited to architectural and decorative interior installations

OVERVIEW

The SW-BP is a bronze switch featuring a patina finish, designed for lighting control and electrical switching applications where a decorative metal aesthetic is required. It functions as a standard wiring device while contributing a weathered, aged appearance to the surrounding fixture or wall plate assembly.

The patina treatment is applied over solid bronze construction, giving the switch a distinct oxidized surface character suited to architectural and heritage-style installations. This finish differentiates the device from standard painted or plated toggle switches commonly used in contemporary construction.
